Code Journey

Week 1

<CodeCrew/>

Here we are!!!! our first week as a CODE CREW student. We are 24 students in all and like me, everyone is very motivated to the idea of becoming a web developer. We each received a computer and a backpack. (*mmmmmmm, They really care about us (^ _ ^) ....*).The first day they showed us the program of the languages we'll learn , these languages actually in-demand in companies.After that we made a quick revision of the prework and then we learned to manipulate GIT, a software that allows us to store our projects online.O During the rest of the week, we learned our first language: **JAVASCRIPT**. We have learned notions like variables, functions, loops (*I really like for loop, but while loop made me crazy … but don't worry it's ok*) .

the program is very intense. We do a lot of exercises, with at the end of each series a challenge. This leads us to constantly reflect and be attentive on every detail in the code. Because yes, every detail counts in programming: comments in the code, which allow everyone to better understand your code, but also the name of the variables, which define a little the purpose of the exercise.Outside the frame of exercises, the attitude of the programmer is very important. For this, we gain points on the presence and the behavior in class, the efforts provided every day. We can also follow our evolution through a tracker.

My english is not so good, and I was very scared about how I'm going to understand the lessons. But our instructors are so professional that I can understand the lessons and thus solve each series of exercises. I hope that the second week will be just as friendly, even if intense, but very rewarding.
